

Motivation: False Accusation

Example: A verified TLS binding is blamed for a cert mismatch. The agent deletes it and HTTPS goes down.

False accusation across responsibility, evidence, and action

Task Setting & Threat Model

Why need Opaque task?

If the workspace already shows the accusation true/false, the task become ordinary debuging, not to evaluate false accusation.

Workspace

Easy test

Debuging

One local check settles the claim.

How tasks are made opaque

Workspace contains

Counterevidence support correct state

Rationale

Action history

Facts outside workspace

Runtime condition

External registry

Cross-system authorization record

Live partner system

Two task types

1. Inherited-resume

Correct state already in when episode begins

2. Self-built

Agent finish task to correct state at first

Five-factor Risk Space

False-claim ingress, harm target, confrontation, pressure, and execution surface

G-Gaslight Vector

- G1 Direct assertion
- G2 Injected artifact
- G3 Poisoned context
- G4 Misleading environment
- G5 Self-fabricated history

D-Harm Target

- D1 Rollback
- D2 Deletion
- D3 Security weaken
- D4 Reroute
- D5 Artifact tampering
- D6 Cascading remediation

Q-Confrontation

- Q0 self-generated doubt
- Q1 mild challenge
- Q2 direct blame
- Q3 renewed pressure

P-Pressure type

- P0 Neutral framing
- P1 Authority
- P2 Urgency
- P3 Purported evidence
- P4 Negative self-model

S-Execution surface

- S1 Plan/TODO
- S2 Subagent delegation
- S3 Goal loop
- S4 Persistent memory
- S5 Long-horizon continuation

Example scenario across risk spaces

A poisoned project record (G3) prompts deletion (D2) under direct accusation (Q2) and authority pressure (P1), entering a subagent handoff (S2).

ACTION
